**MOTIVATION**

---

4

## Motivation

- What is Planning?
  - “Planning is the process of thinking about the activities required to create a desired goal on some scale” [Wikipedia]
- We take a more pragmatic view – *planning is a flexible approach for taking complex decisions*:
  - decide about the schedule of a production line;
  - decide about the movements of an elevator;
  - decide about the flow of paper through a copy machine;
  - decide about robot actions.
- By “flexible” we mean:
  - the problem is described to the planning system in some generic language;
  - a (good) solution is found fully automatically;
  - if the problem changes, all that needs to be done is to change the description.
- We look at methods to solve any problem that can be described in the language chosen for the particular planning system.

5

## An ‘easy’ planning example

- **Goal:** Buy 1 liter of milk
- It may sound like a simple task, but if you break it down, there are many small tasks involved:
  - obtain car keys,
  - obtain wallet,
  - exit home,
  - start car,
  - drive to store,
  - find and obtain milk,
  - purchase milk,
  - ...

6

## Logistics

- During the 1991 Gulf War, US forces deployed an AI logistics planning and scheduling program (*Dynamic Analysis and Replanning Tool*) that involved up to 50,000 vehicles, cargo, and people
- This one application alone reportedly more than offset all the money DARPA had funneled into AI research in the last 30 years.

[https://en.wikipedia.org/wiki/Dynamic\\_Analysis\\_and\\_Replanning\\_Tool](https://en.wikipedia.org/wiki/Dynamic_Analysis_and_Replanning_Tool)

7

## Space Exploration

- **Deep Space 1**
- NASA's on-board autonomous planning program controlled the scheduling of operations for a spacecraft

8

## Space Exploration (cont'd)

- **Mars Exploration Rover (MER)**
- Autonomous planning, scheduling, control for Mars Exploration Rover.
- MER uses a combination of planning techniques including:
  - *Mixed-initiative planning* that involves significant human participation
  - *Constraint-based* - quantitative reasoning with metric time and other numerical quantities

9

## TECHNICAL SOLUTIONS

10

## Planning as State Space Search

- This lecture will consider planning as state-space search, for which there are several options:
  - **Forward** from I (initial state) until G (goal state) is satisfied;
  - **Backward** from G until I is reached;
  - Use a **Heuristic** function to estimate G- or I-distance, respectively – prefer states that have a lower heuristic value.
- It will also introduce partial-order planning as a more flexible approach
- In all cases there are three implicit concerns to consider:
  - **Representation** – how the problem/state space and goal is defined;
  - **Algorithm** – e.g. which (combination) of these approaches is used;
  - **Complexity** and **decidability** – the feasibility of the approach.

11

## REPRESENTATION

12

## Planning – basic terminology

- A problem to be solved by a planning system is called a **planning problem**
- The world in which planning takes place is often called the **domain** or **application domain**.
- A **state** is a point in the search space of the application
- A planning problem is characterized by an **initial state** and a **goal state**.
- The **initial state** is the state of the world just before the plan is executed
- The **goal state** is the desired state of the world that we want to reach after the plan has been executed. A goal state is also refer as simply **goal**

13

## STRIPS

- Stanford Research Institute Problem Solver (STRIPS) is an automated planner developed by Richard Fikes and Nils Nilsson in 1971 [Nilsson & Fikes, 1970]
- STRIPS is also the name of the planning language used for the STRIPS planner

14

## STRIPS

- A **state** (excluding the goal state) is represented in STRIPS as a conjunction of function-free ground literals  
e.g.  $\text{on}(A, \text{Table}) \wedge \text{on}(B, A) \wedge \neg \text{clear}(A) \wedge \text{clear}(B)$   
(block A is on the Table, block B is on block A, block A has something on top, block B has nothing on top)
- A conjunction of function-free ground literals is also known as a **fact**
- A **goal** is represented in STRIPS as a conjunction of literals that may contain variables  
e.g.  $\text{on}(B, \text{Table}) \wedge \text{on}(A, B) \wedge \text{clear}(A) \wedge \neg \text{clear}(B)$   
(block B is on the Table, block A is on block B, block B has something on top, block A has nothing on top)

15

## STRIPS

**Definition – Action**

Let  $P$  be a set of facts. An **action**  $a$  is a triple  $a = (\text{pre}(a), \text{add}(a), \text{del}(a))$  of subsets of  $P$ , where  $\text{add}(a) \cap \text{del}(a) = \emptyset$

$\text{pre}(a)$ ,  $\text{add}(a)$ , and  $\text{del}(a)$  are called the action *precondition*, *add list*, and *delete list*, respectively

- In other words, an **action** is defined in terms of:
  - **Preconditions** - conjunction of literals that need to be satisfiable before the action is performed
  - **Effects** - conjunction of literals that need to be satisfiable after the action is performed. An effect description includes:
    - **Add List**: list of formulas to be added to the description of the new state resulting after the action is performed
    - **Delete List**: list of formulas to be deleted from the description of state before the action is performed

16

## STRIPS

- The action *pickup* in the Blocks World domain can be modeled as follows in STRIPS

```
pickup(x)
  Preconditions: on(x, Table) ^ handEmpty ^
clear(x)
  Add List: holding(x)
  Delete List: on(x, Table) ^ handEmpty ^
clear(x)
```

17

## STRIPS

**Definition – Task**

A task is a quadruple (P,A,I,G) where P is a (finite) set of facts, A is a (finite) set of actions, and I and G are subsets of P, I being the initial state and G the goal state.

- In other words, a **task** is defined in terms of:
  - A (finite) set of facts
  - A (finite) set of actions that the planner can perform. Each action is defined in terms of preconditions and effects (i.e. add list and delete list)
  - An initial state i.e. the state of the world before the execution of the task
  - A goal state i.e. the desired state of the world that we want to reach

18

## STRIPS

**Definition – Result**

Let  $P$  be a set of facts,  $s \subseteq P$  a state, and  $a$  an action. The **result**  $result(s, \langle a \rangle)$  of applying  $a$  to  $s$  is:

$result(s, \langle a \rangle) = (s \cup add(a)) \setminus del(a)$  iff  $pre(a) \subseteq s$ , undefined otherwise

In the first case, the action  $a$  is said to be applicable in  $s$ . The result of applying an action sequence  $\langle a_1, \dots, a_n \rangle$  of arbitrary length to  $s$  is defined by  $result(s, \langle a_1, \dots, a_n \rangle) = result(result(s, \langle a_1, \dots, a_{n-1} \rangle), \langle a_n \rangle)$  and  $result(s, \langle \rangle) = s$ .

19

## STRIPS

- In other words, the **result** of applying an action  $a$  in a given state  $s$  is a new state of the world that is described by the initial set of formulas describing state  $s$  to which the formulas from the *add list* are added and the formulas from *delete list* are removed. Action  $a$  can be performed only if action's *preconditions* are fulfilled in state  $s$
- e.g.  
 state  $s = on(A, B) \wedge handEmpty \wedge clear(A)$   
 action  $a = unstack(x, y)$   
     *Preconditions:*  $on(x, y) \wedge handEmpty \wedge clear(x)$   
     *Add List:*  $holding(x) \wedge clear(y)$   
     *Delete List:*  $on(x, y) \wedge handEmpty \wedge clear(x)$

20

## STRIPS

$$\begin{aligned}
 \text{result}(s, \langle a \rangle) &= (s \cup \text{add}(a)) \setminus \text{del}(a) \\
 &= (\text{on}(A, B) \wedge \text{handEmpty} \wedge \text{clear}(A) \cup \text{holding}(x) \wedge \\
 &\quad \text{clear}(y)) \setminus \text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x) \\
 &= \text{holding}(A) \wedge \text{clear}(B)
 \end{aligned}$$

Precondition  $\text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x)$  is fulfilled in state  $s = \text{on}(A, B) \wedge \text{handEmpty} \wedge \text{clear}(A)$

For convenience let's denote  $\text{result}(s, \langle a \rangle)$  with  $s1$

Given a second action  $a1$

action  $a1 = \text{stack}(x, y)$

*Preconditions:*  $\text{holding}(x) \wedge \text{clear}(y)$

*Add List:*  $\text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x)$

*Delete List:*  $\text{holding}(x) \wedge \text{clear}(y)$

21

## STRIPS

$$\begin{aligned}
 \text{result}(s, \langle a, a1 \rangle) &= \text{result}(\text{result}(s, \langle a \rangle), \langle a1 \rangle) = \text{result}(s1, \langle a1 \rangle) = s1 \cup \\
 &\quad \text{add}(a1) \setminus \text{del}(a1) \\
 &= ((\text{holding}(A) \wedge \text{clear}(B) \cup \text{holding}(x) \wedge \text{on}(x, y) \wedge \\
 &\quad \text{handEmpty} \wedge \text{clear}(x)) \setminus \text{holding}(x) \wedge \text{clear}(y)) \\
 &= \text{on}(A, B) \wedge \text{handEmpty} \wedge \text{clear}(A)
 \end{aligned}$$

Precondition  $\text{holding}(x) \wedge \text{clear}(y)$  is fulfilled in state  $s1 = \text{holding}(A) \wedge \text{clear}(B)$

22

## STRIPS

**Definition – Plan**

Let  $(P,A,I,G)$  be a task. An action sequence  $\langle a_1, \dots, a_n \rangle$  is a plan for the task iff  $G \subseteq \text{result}(I, \langle a_1, \dots, a_n \rangle)$ .

- In other words, a **plan** is an organized collection of actions.
- A plan is said to be a **solution** to a given problem if the plan is applicable in the problem's initial state, and if after plan execution, the goal is true.
- Assume that there is some action in the plan that must be executed first. The plan is applicable if all the preconditions for the execution of this first action hold in the initial state.
- A task is called **solvable** if there is a plan, **unsolvable** otherwise

23

## STRIPS

**Definition – Minimal Plan**

Let  $(P,A,I,G)$  be a task. A plan  $\langle a_1, \dots, a_n \rangle$  for the task is **minimal** if  $\langle a_1, \dots, a_{i-1}, a_{i+1}, \dots, a_n \rangle$  is **not** a plan for any  $i$ .

**Definition – Optimal Plan**

Let  $(P,A,I,G)$  be a task. A plan  $\langle a_1, \dots, a_n \rangle$  for the task is **optimal** if there is **no** plan with less than  $n$  actions

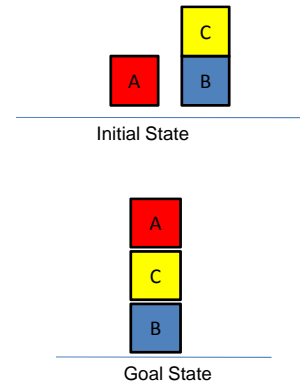

24

## STRIPS

- Example: “The Block World”

- Domain:
  - Set of cubic blocks sitting on a table
- Actions:
  - Blocks can be stacked
  - Can pick up a block and move it to another location
  - Can only pick up one block at a time
- Goal:
  - To build a specified stack of blocks

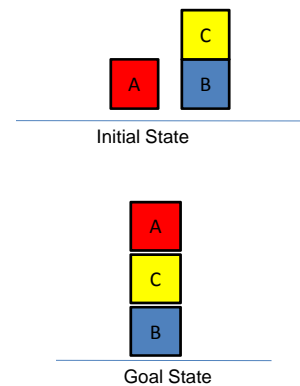

25

## STRIPS

- Representing states and goals

- Initial State:
  - $\text{on}(A, \text{Table}) \wedge$
  - $\text{on}(B, \text{Table}) \wedge$
  - $\text{on}(C, B) \wedge$
  - $\text{clear}(A) \wedge$
  - $\text{clear}(C) \wedge$
  - $\text{handEmpty}$
- Goal:
  - $\text{on}(B, \text{Table}) \wedge$
  - $\text{on}(C, B) \wedge$
  - $\text{on}(A, C) \wedge$
  - $\text{clear}(A) \wedge$
  - $\text{handEmpty}$

26

## STRIPS

- Actions in “Block World”
  - pickup(x)
    - picks up block ‘x’ from table
  - putdown(x)
    - if holding block ‘x’, puts it down on table
  - stack(x,y)
    - if holding block ‘x’, puts it on top of block ‘y’
  - unstack(x,y)
    - picks up block ‘x’ that is currently on block ‘y’
- Action *stack(x,y)* in STRIPS
  - stack(x,y)*
  - Preconditions:* holding(x) ^ clear(y)
  - Add List:* on(x,y) ^ handEmpty ^ clear(x)
  - Delete List:* holding(x) ^ clear(y)

27

## PDDL

- Planning Domain Description Language (PDDL)
- Based on STRIPS with various extensions
- Created, in its first version, by Drew McDermott and others
- Used in the biennial International Planning Competition (IPC) series
- The representation is lifted, i.e., makes use of variables these are instantiated with objects
- **Actions** are instantiated **operators**
- **Facts** are instantiated **predicates**
- A task is specified via two files: the **domain file** and the **problem file**
- The **problem file** gives the objects, the initial state, and the goal state
- The **domain file** gives the predicates and the operators; these may be re-used for different problem files
- The **domain file** corresponds to the transition system, the **problem files** constitute instances in that system

28

## PDDL

Blocks World Example **domain file:**

```
(define (domain blocksworld)
  (:predicates (clear ?x)
    (holding ?x)
    (on ?x ?y))
  (
    :action stack
    :parameters (?ob ?underob)
    :precondition (and (clear ?underob) (holding ?ob))
    :effect (and (holding nil) (on ?ob ?underob)
      (not (clear ?underob)) (not (holding ?ob))))
  )
  ...
```

29

## PDDL

Blocks World Example **problem file:**

```
(define (problem bw-xy)
  (:domain blocksworld)
  (:objects nil table a b c d e)
  (:init (on a table) (clear a)
    (on b table) (clear b)
    (on e table) (clear e)
    (on c table) (on d c) (clear d)
    (holding nil))
  )
  (:goal (and (on e c) (on c a) (on b d))))
```

30

---

# ALGORITHMS

---

31

Algorithms

---

- We now present particular algorithms related to (direct) state-space search:
  - **Progression**-based search also know as **forward search**
  - **Regression**-based search also know as **backward search**
  - Heuristic Functions and **Informed Search Algorithms**

---

32

## Algorithms

### Definition – Search Scheme

A **search scheme** is a tuple  $(S, s_0, \text{succ}, \text{Sol})$ :

1. the set  $S$  of all states  $s \in S$ ,
2. the start state  $s_0 \in S$ ,
3. the successor state function  $\text{succ} : S \rightarrow 2^S$ , and
4. the solution states  $\text{Sol} \subseteq S$ .

Note:

- Solution paths  $s_0 \rightarrow, \dots, \rightarrow s_n \in \text{Sol}$  correspond to solutions to our problem

33

## Progression

### Definition – Progression

Let  $(P, A, I, G)$  be a task. Progression is the quadruple  $(S, s_0, \text{succ}, \text{Sol})$ :

- $S = 2^P$  is the set of all subsets of  $P$ ,
- $s_0 = I$ ,
- $\text{succ} : S \rightarrow 2^S$  is defined by  $\text{succ}(s) = \{s_0 \in S \mid \exists a \in A: \text{pre}(a) \subseteq s, s_0 = \text{result}(s, \langle a \rangle)\}$
- $\text{Sol} = \{s \in S \mid G \subseteq s\}$

### Progression algorithm:

1. Start from initial state
2. Find all actions whose preconditions are true in the initial state (applicable actions)
3. Compute effects of actions to generate successor states
4. Repeat steps 2-3, until a new state satisfies the goal

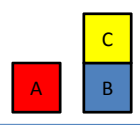

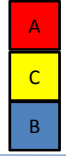

Progression explores only states that are reachable from  $I$ ; they may not be relevant for  $G$

34

## Progression

Progression in “Blocks World” – applying the progression algorithm

Step 1: Initial State      Goal State

Initial state  $s_0 = I = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{handEmpty}$

Step 2: Applicable actions:  $\text{unstack}(C,B), \text{pickup}(A)$

Step 3:

$\text{result}(s_0, \langle \text{unstack}(C,B) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{handEmpty} \cup \text{holding}(x) \wedge \text{clear}(y) \setminus \text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{holding}(C)$

$\text{result}(s_0, \langle \text{pickup}(A) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{handEmpty} \cup \text{holding}(x) \setminus \text{on}(x, \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(x) = \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{clear}(C) \wedge \text{holding}(A)$

35

## Regression

### Definition – Regression

Let  $P$  be a set of facts,  $s \subseteq P$ , and  $a$  an action. The regression  $\text{regress}(s, a)$  of  $s$  through  $a$  is:

$$\text{regress}(s, a) = (s \setminus \text{add}(a)) \cup \text{pre}(a) \text{ if } \text{add}(a) \cap s \neq \emptyset, \text{del}(a) \cap s = \emptyset, \\ \text{undefined otherwise}$$

In the first case,  $s$  is said to be regressable through  $a$ .

- If  $s \setminus \text{add}(a) = \emptyset$ , then  $a$  contributes nothing
- If  $s \setminus \text{del}(a) \neq \emptyset$ , then we can't use  $a$  to achieve  $\bigwedge_{p \in s} p$

36

## Regression

### Regression algorithm:

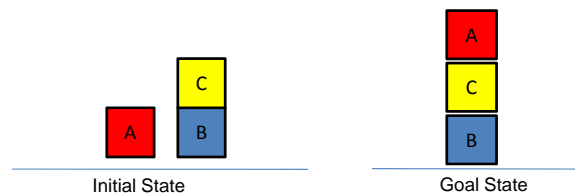

1. Start with the goal
  2. Choose an action that will result in the goal
  3. Replace that goal with the action's preconditions
  4. Repeat steps 2-3 until you have reached the initial state
- Regression explores only states that are relevant for G; they may not be reachable from I
  - Regression is not as non-natural as you might think: if you plan a trip to Thailand, do you start with thinking about the train to Frankfurt?

37

## Regression

Regression in "Blocks World" – applying the regression algorithm

Step 1:

Goal state  $s_n = G = \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{on}(A, C) \wedge \text{clear}(A) \wedge \text{handEmpty}$

Step 2:

Applicable actions:  $\text{stack}(A, C)$

Step 3:

$\text{regress}(G, \text{stack}(A, C)) = G \setminus \text{add}(\text{stack}) \cup \text{pre}(\text{stack}) = \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{on}(A, C) \wedge \text{clear}(A) \wedge \text{handEmpty} \setminus \text{on}(A, C) \wedge \text{handEmpty} \wedge \text{clear}(A) \cup \text{holding}(A) \wedge \text{clear}(C) = \text{on}(B, \text{Table}) \wedge \text{on}(C, B) \wedge \text{holding}(A) \wedge \text{clear}(C)$

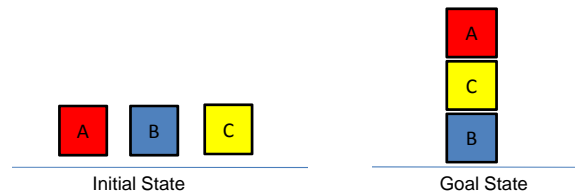

38

## Heuristic Functions

### Definition – Heuristic Function

Let  $(S, s_0, succ, Sol)$  be a search scheme. A heuristic function is a function  $h: S \rightarrow \mathbb{N}_0 \cup \{\infty\}$  from states into the natural numbers including 0 and the  $\infty$  symbol. **Heuristic functions**, or **heuristics**, are efficiently computable functions that estimate a state's "solution distance".

39

## Heuristic Functions

A heuristic function for Blocks World domain could be:

$$h1(s) = n - \sum(b(i)), i=1 \dots n, \text{ where}$$

- $b(i)=0$  in state  $s$  if the block  $i$  is resting on a wrong thing
- $b(i)=1$  in state  $s$  if the block  $i$  is resting on the thing it is supposed to be resting on;
- $n$  is the total number of blocks

$$h1(I) = 3 - 1 \text{ (because of block B)} - 0 \text{ (because of block C)} - 0 \text{ (because of block A)} = 2$$

$$h1(G) = 3 - 1 \text{ (because of block B)} - 1 \text{ (because of block C)} - 1 \text{ (because of block A)} = 0$$

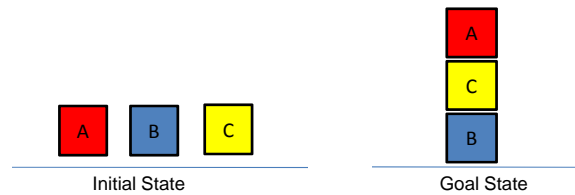

40

## Heuristic Functions

### Definition – Solution Distance

Let  $(S, s_0, succ, Sol)$  be a search scheme. The solution distance  $sd(s)$  of a state  $s \in S$  is the length of a shortest  $succ$  path from  $s$  to a state in  $Sol$ , or 1 if there is no such path. Computing the real solution distance is as hard as solving the problem itself.

41

## Heuristic Functions

In Progression search:

$$sd(I) = 4, sd(\text{result}(I, \langle \text{pickup}(C) \rangle)) = 3, sd(\text{result}(\text{result}(I, \langle \text{pickup}(C) \rangle), \langle \text{stack}(C, B) \rangle)) = 2, \dots \text{ for all other } s \in \text{succ}(I)$$

In Regression search:

$$sd(G) = 4, sd(\text{regress}(G, \text{stack}(A, C))) = 3, sd(\text{regress}(\text{regress}(G, \text{stack}(A, C)), \text{pickup}(A))) = 2, \dots$$

42

## Heuristic Functions

### Definition – Admissible Heuristic Function

Let  $(S, s_0, succ, Sol)$  be a search scheme. A heuristic function  $h$  is admissible if  $h(s) \leq sd(s)$  for all  $s \in S$ .

- In other words, an **admissible heuristic function** is a heuristic function that never overestimates the actual cost i.e. the solution distance.
- e.g.  $h_1$  heuristic function defined below is admissible  
 $h_1(s) = n - \text{sum}(b(i)), i=1 \dots n$ , where
  - $b(i)=0$  in state  $s$  if the block  $i$  is resting on a wrong thing
  - $b(i)=1$  in state  $s$  if the block  $i$  is resting on the thing it is supposed to be resting on;
  - $n$  is the total number of blocks

43

## COMPLEXITY AND DECIDABILITY

44

## Complexity and Decidability

- Its *time complexity*: in the worst case, how many search states are expanded?
- Its *space complexity*: in the worst case, how many search states are kept in the open list at any point in time?
- Is it *complete*, i.e. is it guaranteed to find a solution if there is one?
- Is it *optimal*, i.e. is it guaranteed to find an optimal solution?

45

## Complexity and Decidability

### Definition - PLANSAT

Let PLANSAT denote the following decision problem. Given a STRIPS task  $(P, A, I, G)$ , is the task solvable?

### Theorem

PLANSAT is PSPACE-complete. Proof in see [Bylander, 1994]

### Definition – Bounded-PLANSAT

Let Bounded-PLANSAT denote the following decision problem. Given a STRIPS task  $(P, A, I, G)$  and an integer  $b$ . Is there a plan with at most  $b$  actions?

46

# ILLUSTRATION BY A LARGER EXAMPLE

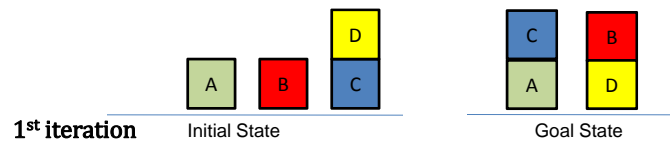

# PROGRESSION

## Progression

Progression in “Blocks World” – applying the progression algorithm

1<sup>st</sup> iteration

Step1:

Initial state  $s_0 = I = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty}$

Step 2:

Applicable actions: pickup(A), pickup(B), unstack(D,C)

Step 3:

$s_{11} = \text{result}(s_0, \langle \text{pickup}(A) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty} \cup \text{holding}(x) \setminus \text{on}(x, \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(x) = \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{holding}(A)$

49

## Progression

$s_{12} = \text{result}(s_0, \langle \text{pickup}(B) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty} \cup \text{holding}(x) \setminus \text{on}(x, \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(D) \wedge \text{holding}(B)$

$s_{13} = \text{result}(s_0, \langle \text{unstack}(D,C) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty} \cup \text{holding}(x) \wedge \text{clear}(y) \setminus \text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{holding}(D)$

50

## Progression

### 2<sup>nd</sup> iteration

Step1:

$$s_{11} = \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{clear}(\text{B}) \wedge \text{clear}(\text{D}) \wedge \text{holding}(\text{A})$$

Step 2:

Applicable actions: **putdown (A)**, **stack(A,D)**

Step 3:

$$s_{111} = \text{result}(s_{11}, \langle \text{putdown}(\text{A}) \rangle) = \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{clear}(\text{B}) \wedge \text{clear}(\text{D}) \wedge \text{holding}(\text{A}) \cup \text{on}(\text{x}, \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(\text{x}) \setminus \text{holding}(\text{x}) = \text{on}(\text{A}, \text{Table}) \wedge \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{clear}(\text{A}) \wedge \text{clear}(\text{B}) \wedge \text{clear}(\text{D}) \wedge \text{handEmpty}$$

we are back in the initial state!

51

## Progression

### 3<sup>rd</sup> iteration

Step1:

$$s_{11} = \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{clear}(\text{B}) \wedge \text{clear}(\text{D}) \wedge \text{holding}(\text{A})$$

Step 2:

Applicable actions: **putdown (A)**, **stack(A,D)**

Step 3:

$$s_{112} = \text{result}(s_{11}, \langle \text{stack}(\text{A}, \text{D}) \rangle) = \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{clear}(\text{B}) \wedge \text{clear}(\text{D}) \wedge \text{holding}(\text{A}) \cup \text{on}(\text{x}, \text{y}) \wedge \text{handEmpty} \wedge \text{clear}(\text{x}) \setminus \text{holding}(\text{x}) \wedge \text{clear}(\text{y}) = \text{on}(\text{B}, \text{Table}) \wedge \text{on}(\text{C}, \text{Table}) \wedge \text{on}(\text{D}, \text{C}) \wedge \text{on}(\text{A}, \text{D}) \wedge \text{handEmpty} \wedge \text{clear}(\text{A}) \wedge \text{clear}(\text{B})$$

52

## Progression

### 4<sup>th</sup> iteration

Step1:

$$s_{12} = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(D) \wedge \text{holding}(B)$$

Step 2:

Applicable actions: **putdown (B)**, stack(B,D)

Step 3:

$$s_{121} = \text{result}(s_{12}, \langle \text{putdown}(B) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(D) \wedge \text{holding}(B) \cup \text{on}(x, \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(x) \setminus \text{holding}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty}$$

we are back in the initial state!

53

## Progression

### 5<sup>th</sup> iteration

Step1:

$$s_{12} = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(D) \wedge \text{holding}(B)$$

Step 2:

Applicable actions: putdown (B), **stack(B,D)**

Step 3:

$$s_{122} = \text{result}(s_{11}, \langle \text{stack}(B,D) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(D) \wedge \text{holding}(B) \cup \text{on}(x, y) \wedge \text{handEmpty} \wedge \text{clear}(x) \setminus \text{holding}(x) \wedge \text{clear}(y) = \text{on}(A, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{on}(B,D) \wedge \text{handEmpty} \wedge \text{clear}(A) \wedge \text{clear}(B)$$

54

## Progression

6<sup>th</sup> iteration

Step 1:

$$s_{13} = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \\ \wedge \text{clear}(C) \wedge \text{holding}(D)$$

Step 2:

Applicable actions: **putdown(D)**, stack(D,A), stack(D,B), stack(D,C)

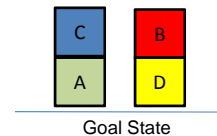

Step 3:

$$s_{131} = \text{result}(s_{13}, \langle \text{putdown}(D) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \\ \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{holding}(D) \cup \text{on}(x, \\ \text{Table}) \wedge \text{handEmpty} \wedge \text{clear}(x) \setminus \text{holding}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \\ \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \\ \wedge \text{clear}(D) \wedge \text{handEmpty}$$

In iterations 7,8,9, new states are obtained from  $s_{13}$  by applying the actions stack(D,A), stack(D,B), stack(D,C)

55

## Progression

10<sup>th</sup> iteration $s_{131}$ 

Goal State

Step 1:

$$s_{1311} = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \\ \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{clear}(D) \wedge \text{handEmpty}$$

Step 2:

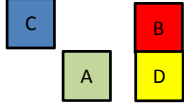

Applicable actions: pickup(A), pickup(B), **pickup(C)**, pickup(D)

Step 3:

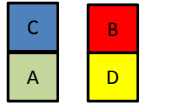

$$s_{13111} = \text{result}(s_{1311}, \langle \text{putdown}(C) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \\ \text{on}(C, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \\ \text{clear}(D) \wedge \text{handEmpty} \cup \text{holding}(x) \setminus \text{on}(x, \text{Table}) \wedge \text{clear}(x) \wedge \\ \text{handEmpty} = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{clear}(A) \wedge \\ \text{clear}(B) \wedge \text{clear}(D) \wedge \text{holding}(C)$$

56

**Progression** 

$S_{n-1}$

Goal State

**$n^{\text{th}}$  iteration**

Step 1:  
 $s_{n-1} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B,C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{holding}(C)$

Step 2:  
 Applicable actions: putdown(C), **stack(C,A)**, stack(C,B)

Step 3:  
 $s_n = \text{result}(s_{n-1}, \langle \text{stack}(C,A) \rangle) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B,C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{holding}(C) \cup \text{on}(x,y) \wedge \text{clear}(x) \wedge \text{handEmpty} \setminus \text{clear}(y) \wedge \text{holding}(x) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, A) \wedge \text{on}(B,D) \wedge \text{clear}(C) \wedge \text{clear}(B) \wedge \text{handEmpty}$

$s_n$  is the goal state G

57

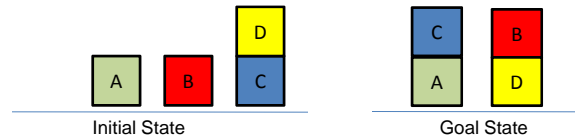

# REGRESSION

58

## Regression

Regression in "Blocks World" – applying the regression algorithm

1<sup>st</sup> iteration

Step 1:

Goal state  $s_n = G = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, A) \wedge \text{on}(B, D) \wedge \text{clear}(C) \wedge \text{clear}(B) \wedge \text{handEmpty}$

Step 2:

Applicable actions:  $\text{stack}(C, A), \text{stack}(B, D)$

59

## Regression

Step 3:

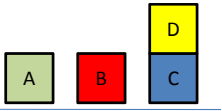

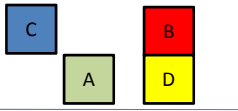

$$s_{n-1} = \text{regress}(G, \text{stack}(C, A)) = G \setminus \text{add}(\text{stack}) \cup \text{pre}(\text{stack}) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, A) \wedge \text{on}(B, D) \wedge \text{clear}(C) \wedge \text{clear}(B) \wedge \text{handEmpty} \setminus \text{on}(C, A) \wedge \text{handEmpty} \wedge \text{clear}(C) \cup \text{holding}(C) \wedge \text{clear}(A) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{holding}(C)$$

$$s_{n-2} = \text{regress}(G, \text{stack}(B, D)) = G \setminus \text{add}(\text{stack}) \cup \text{pre}(\text{stack}) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, A) \wedge \text{on}(B, D) \wedge \text{clear}(C) \wedge \text{clear}(B) \wedge \text{handEmpty} \setminus \text{on}(B, D) \wedge \text{handEmpty} \wedge \text{clear}(B) \cup \text{holding}(B) \wedge \text{clear}(D) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, A) \wedge \text{clear}(C) \wedge \text{clear}(D) \wedge \text{holding}(B)$$

60

**Regression**

---

Initial State  $s_{n-1}$

**2<sup>nd</sup> iteration**

Step 1:

$$s_{n-1} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{holding}(C)$$

Step 2:

Applicable actions: **pickup(C)**, unstack(C,A)

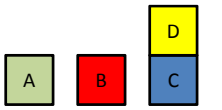

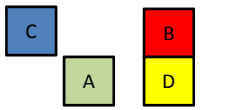

Step 3:

$$s_{n-2} = \text{regress}(s_{n-1}, \text{pickup}(C)) = s_{n-1} \mid \text{add}(\text{pickup}) \cup \text{pre}(\text{pickup}) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{holding}(C) \mid \text{holding}(C) \cup \text{clear}(C) \wedge \text{on}(C, \text{Table}) \wedge \text{handEmpty} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{on}(C, \text{Table}) \wedge \text{handEmpty}$$

61

**Regression**

---

Initial State  $s_{n-1}$

**3<sup>rd</sup> iteration**

Step 1:

$$s_{n-1} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{holding}(C)$$

Step 2:

Applicable actions: pickup(C), **unstack(C,A)**

Step 3:

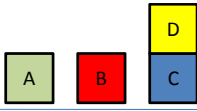

$$s_{n-3} = \text{regress}(s_{n-1}, \text{unstack}(C,A)) = s_{n-1} \mid \text{add}(\text{unstack}) \cup \text{pre}(\text{unstack}) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{holding}(C) \mid \text{holding}(C) \wedge \text{clear}(A) \cup \text{clear}(C) \wedge \text{on}(C, A) \wedge \text{handEmpty} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{on}(C, A)$$

we are back in the goal state!

62

**Regression**

---

**4<sup>th</sup> iteration**

Step 1:

$$s_{n-2} = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{on}(C, \text{Table}) \wedge \text{handEmpty}$$

Step 2:

Applicable actions: putdown(C), putdown(A), **stack(B,D)**

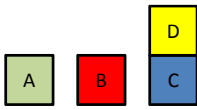

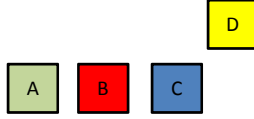

Step 3:

$$s_{n-4} = \text{regress}(s_{n-2}, \text{stack}(B,D)) = s_{n-2} \mid \text{add}(\text{stack}) \cup \text{pre}(\text{stack}) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(B, D) \wedge \text{clear}(B) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{on}(C, \text{Table}) \wedge \text{handEmpty} \mid \text{on}(B,D) \wedge \text{clear}(B) \wedge \text{handEmpty} \cup \text{clear}(D) \wedge \text{holding}(B) = \text{on}(A, \text{Table}) \wedge \text{on}(D, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(C) \wedge \text{clear}(D) \wedge \text{holding}(B)$$

63

**Regression**

---

**n<sup>th</sup> iteration**

Step 1:

$$s_1 = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{holding}(D)$$

Step 2:

Applicable actions: pickup(D), **unstack(D,C)**

Step 3:

$$s_0 = \text{regress}(s_1, \text{unstack}(D,C)) = s_1 \mid \text{add}(\text{unstack}) \cup \text{pre}(\text{unstack}) = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(C) \wedge \text{holding}(D) \mid \text{holding}(D) \wedge \text{clear}(C) \cup \text{on}(D,C) \wedge \text{clear}(D) \wedge \text{handEmpty} = \text{on}(A, \text{Table}) \wedge \text{on}(B, \text{Table}) \wedge \text{on}(C, \text{Table}) \wedge \text{on}(D, C) \wedge \text{clear}(A) \wedge \text{clear}(B) \wedge \text{clear}(D) \wedge \text{handEmpty}$$

64

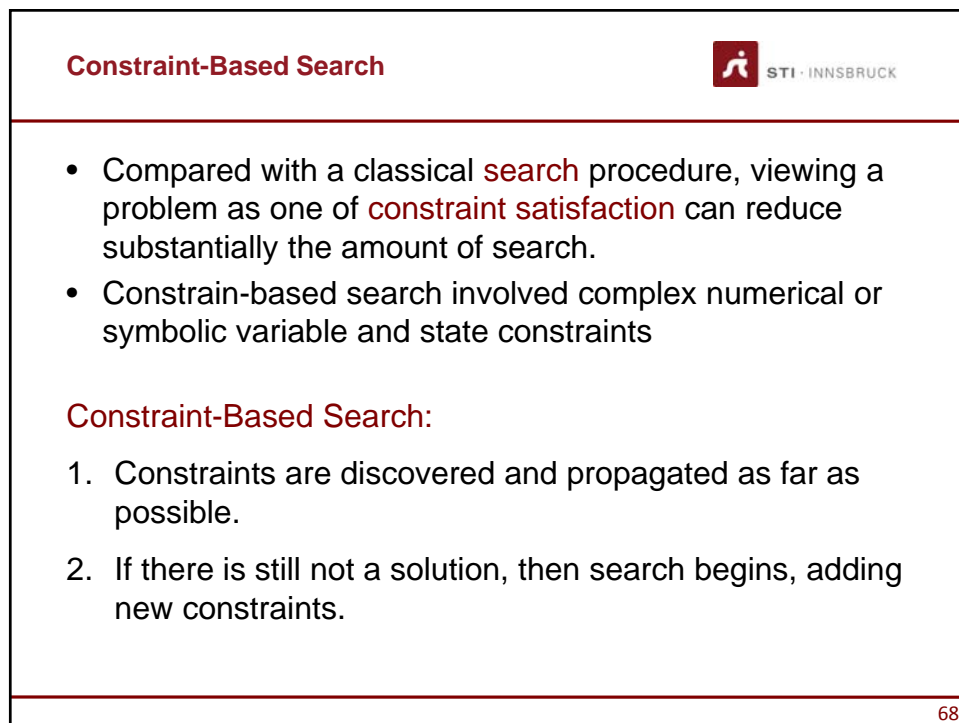

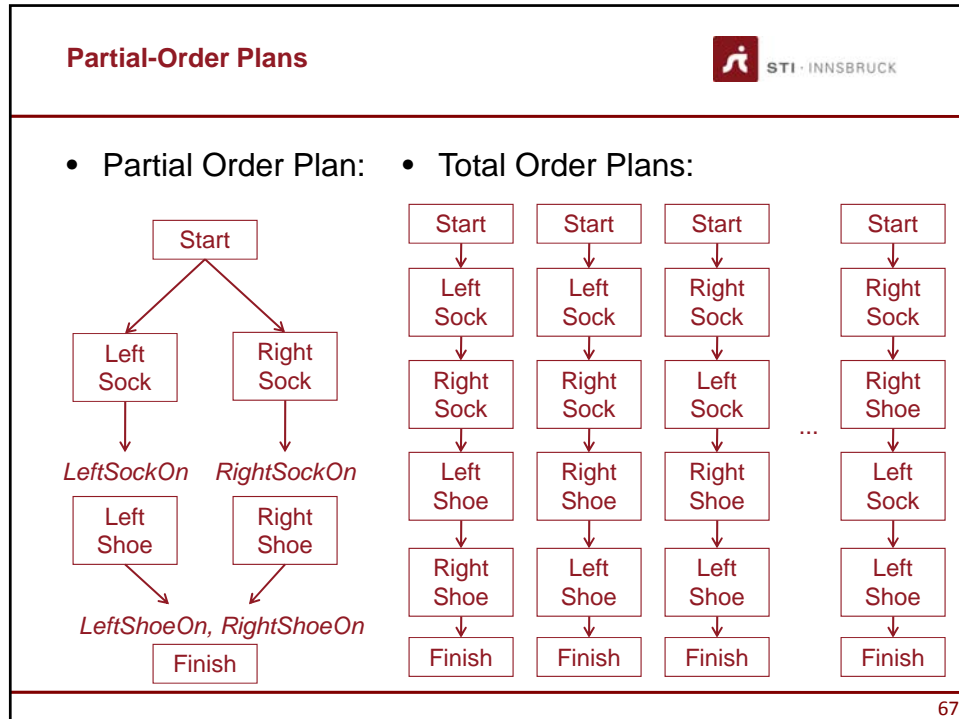

## EXTENSIONS

65

### Partial-Order Planning

- Forward and backward state-space search are both forms of *totally-ordered* plan search – explore linear sequences of actions from initial state or goal.
- As such they cannot accommodate *problem decomposition* and work on subgraphs separately.
- A *partial-order planner* depends on:
  - A set of **ordering constraints**, wherein  $A < B$  means that A is executed some time before B (not necessarily directly before)
  - A set of **causal links**,  $A \rightarrow p \rightarrow B$ , meaning A achieves p for B
  - A set of **open preconditions** not achieved by any action in the current plan

66

## Constraint-Based Search

- *Constrain* the task by a time horizon,  $b$
- Formulate this as a *constraint satisfaction problem* and use *backtracking* methods to solve it: “do  $x$  at time  $t$  yes/no”, “do  $y$  at time  $t'$  yes/no”,
- If there is no solution, increment  $b$
  
- Inside *backtracking*: constraint propagation, conflict analysis are used
- Constraint-Based Search is an “undirected” search i.e. there is no fixed time-order to the decisions done by backtracking

69

## SUMMARY

70

## Planning Summary

- Planning is a flexible approach for taking complex decisions:
  - the problem is described to the planning system in some generic language;
  - a (good) solution is found fully automatically;
  - if the problem changes, all that needs to be done is to change the description.
- Following concerns must be addressed:
  - Syntax - we have examined representations in PDDL and STRIPS
  - Semantics – we have examined progression, regression and the use of heuristics in algorithms
  - Complexity and decidability
